

Trends in extensive grazing systems in Europe

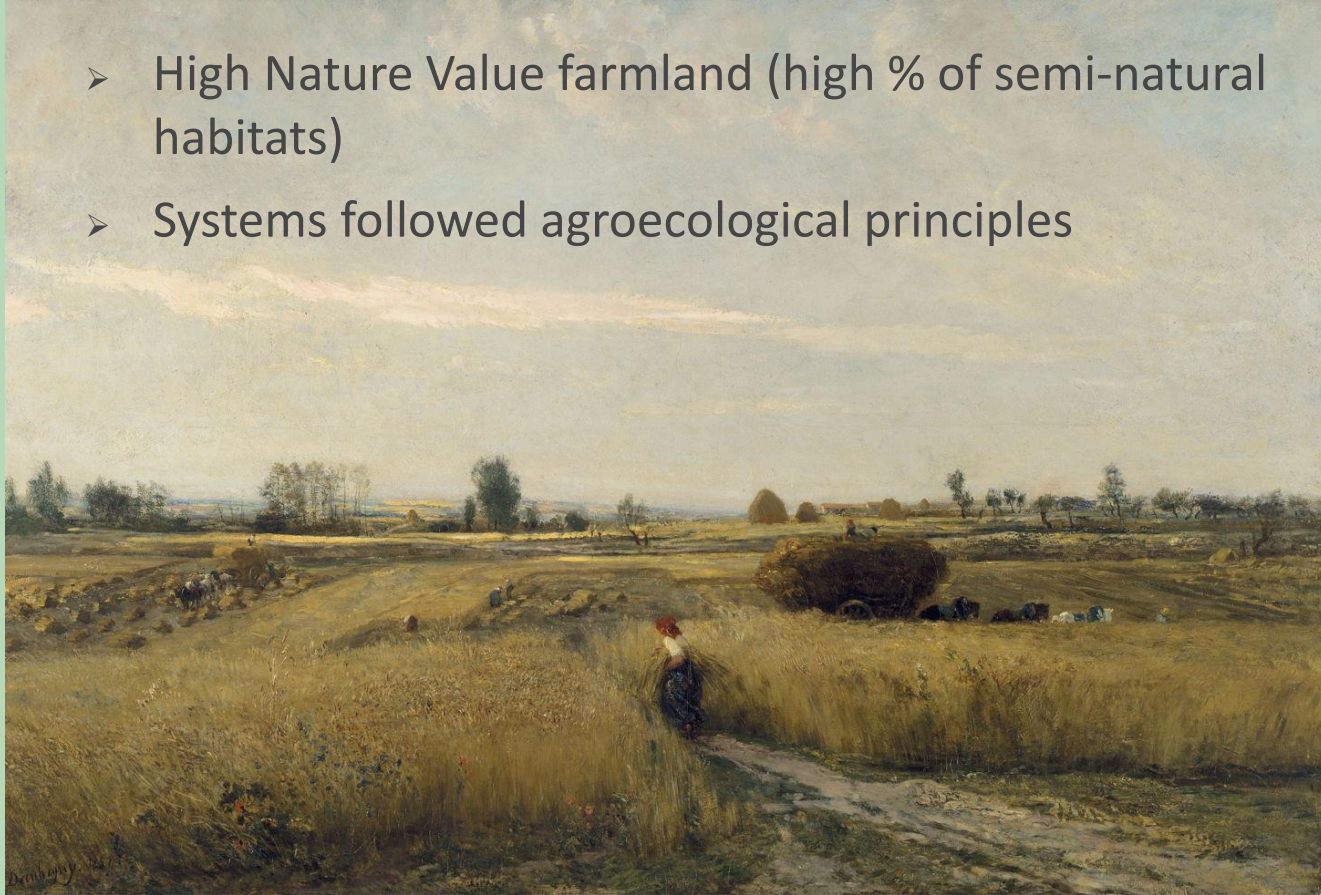

Gwyn Jones gwyn@efncp.org

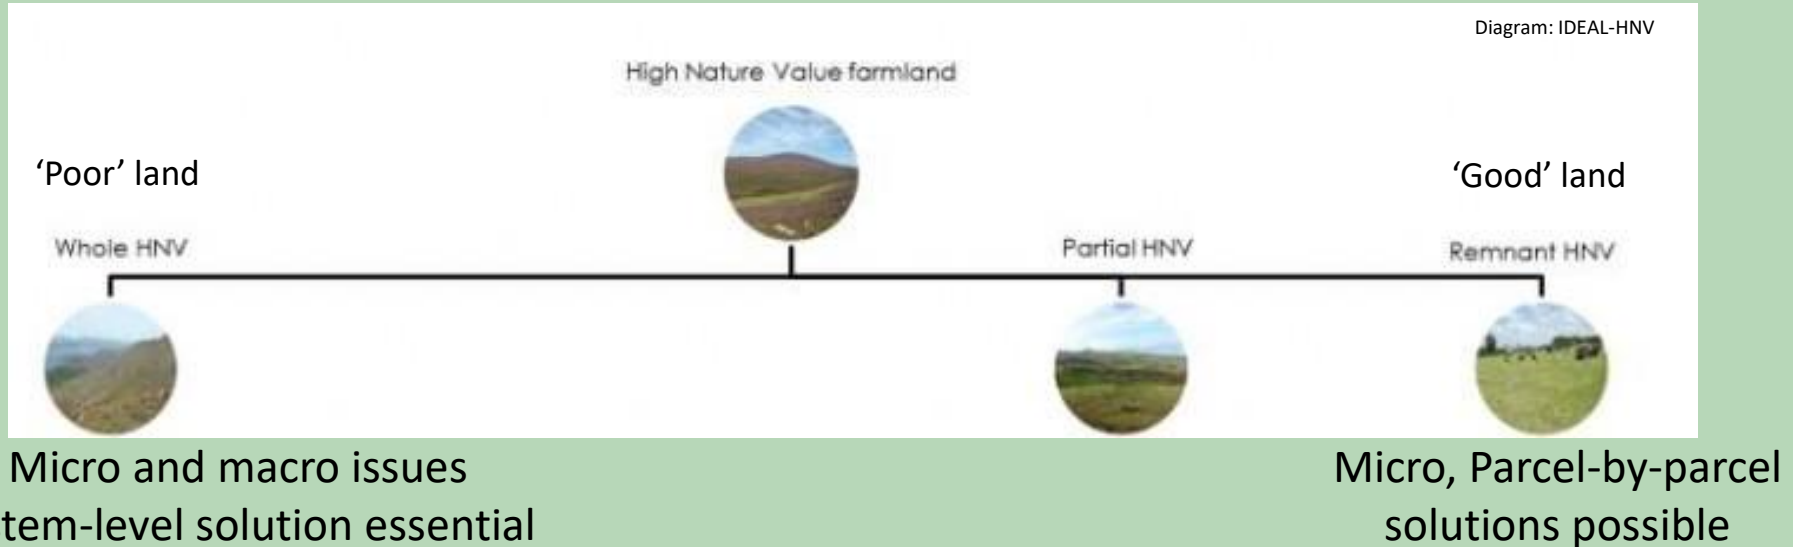

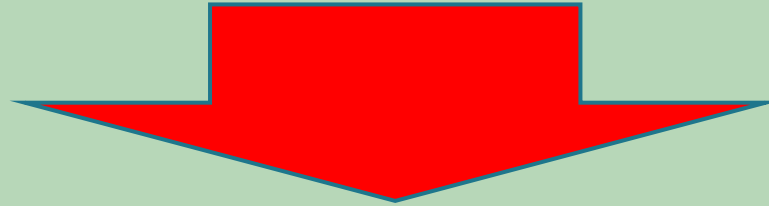

Once all (sustainable) agricultural systems were full of 'nature'

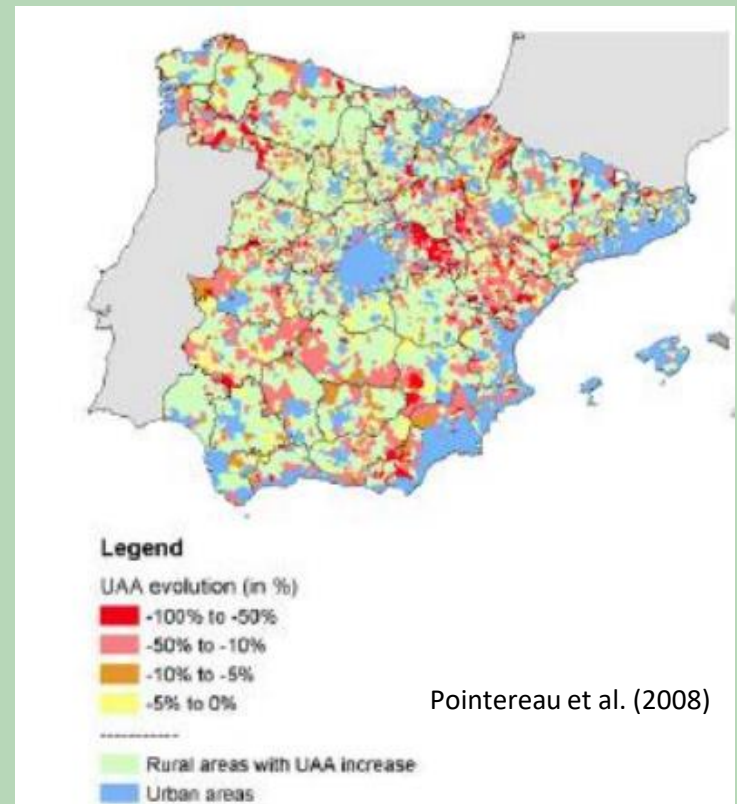

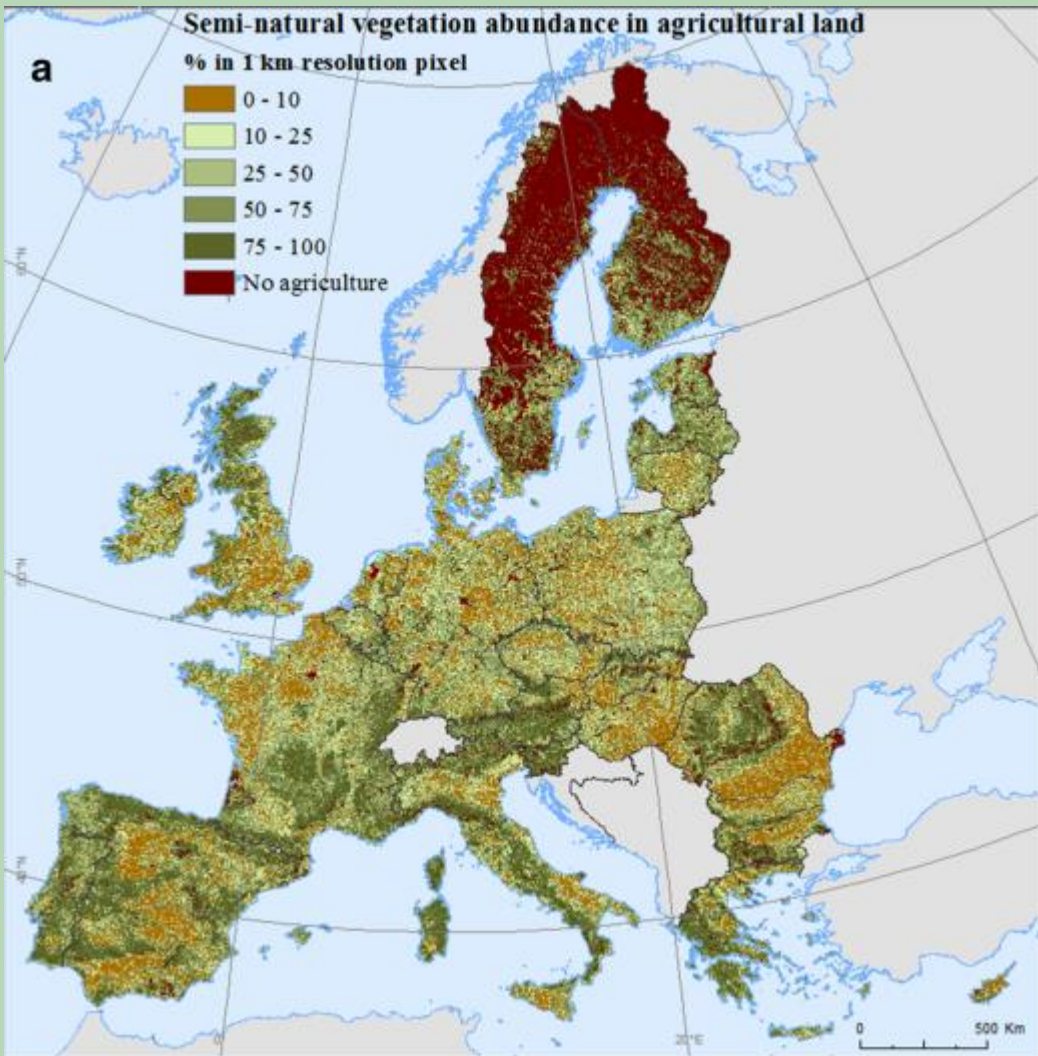

- High Nature Value farmland (high % of semi-natural habitats)
- Systems followed agroecological principles

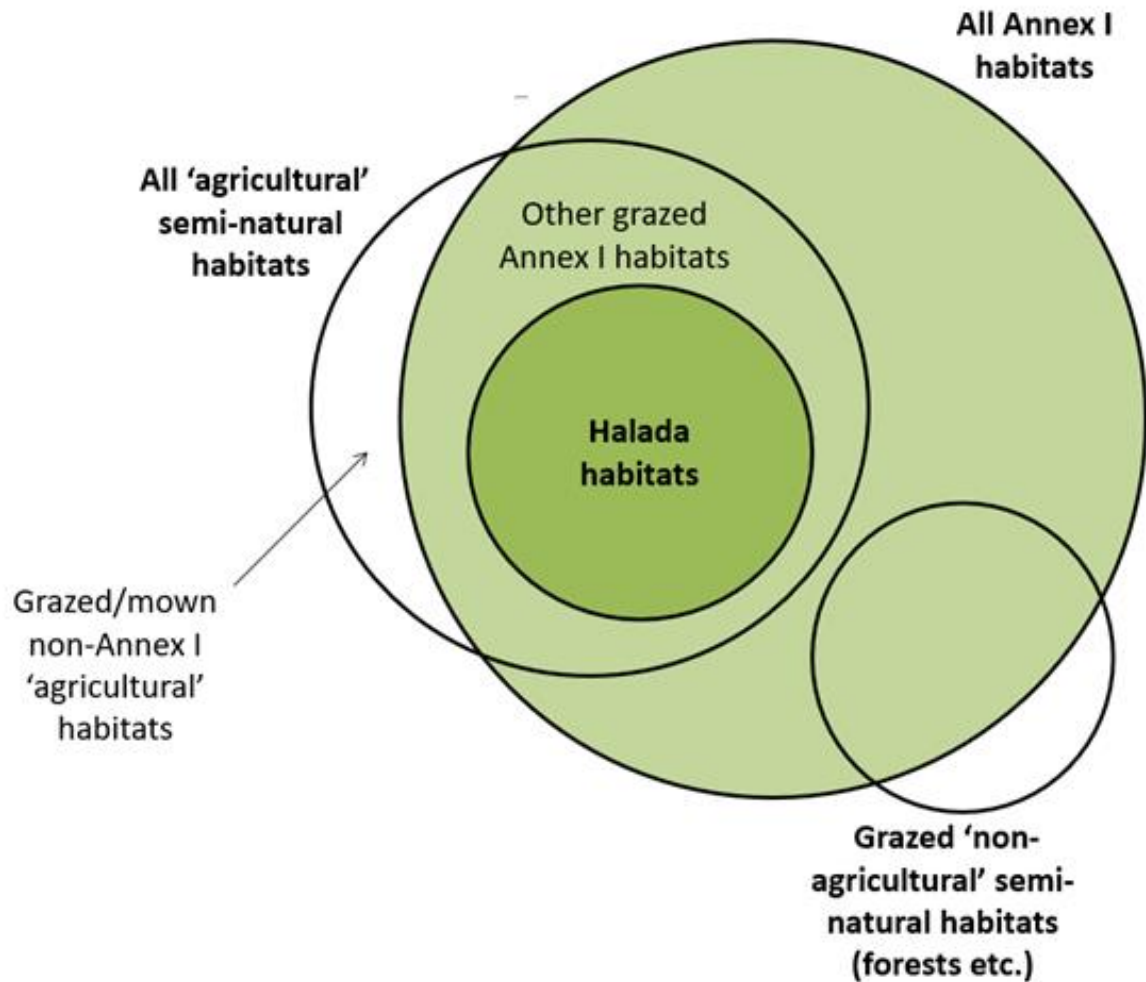

- Technical and technological opportunities to increase profit
- Easier access to markets
- Widening social and economic opportunities/challenges
- Push towards intensification and abandonment in all regions

Pointereau et al. (2008)

The case of Spain

SPAIN

Our challenges

- How to make managing High Nature Value farmland viable (profitable and socially-acceptable) without losing the nature value?
- Finding a delivery scale which is both acceptable and effective (or changing our policy goals)
